OPTIBELT

TECHNICAL MANUAL RUBBER TIMING BELTS

TECHNICAL MANUAL
TIMING BELTS RUBBER

Rubber timing belts in basic design optibelt OMEGA, optibelt STD and optibelt ZR were developed for use in low to medium power ranges. The drive speed is synchronously (i.e. without any speed loss) transmitted with a constant transmission ratio. These timing belts for use in low to medium power ranges offer optimal availability and economic efficiency for drives with low technical requirements.

Timing belts for higher power ranges such as OMEGA HP, OMEGA High Power and OMEGA High Load are particularly useful for drives subject to high loads as well as very technically demanding drives. These timing belts offer the highest performance while also reducing drive width. These products also allow users to react to special drive conditions (such as very high loads, shock loads inside the drive, etc.).

The tooth shape, specially designed by Optibelt, reduces the running noise and forms the basis of all performance classes. Tooth meshing is precise and low-friction. The Optibelt tooth profile runs in HTD and RPP timing belt pulleys.

All important information on intended and proper use as well as methods for calculating and setting correct pretension of rubber timing belts can be found in this technical manual.

The rubber timing belts of the Optibelt product family are available in the following power classes:

Basic design:	optibelt OMEGA
	optibelt STD
	optibelt ZR
HP design:	optibelt OMEGA HP
	optibelt STD HP
	optibelt FAN POWER
High Power design:	optibelt OMEGA High Power
	optibelt OMEGA High Power EPDM
High Load design:	optibelt OMEGA High Load
	optibelt OMEGA High Load EPDM

as well as linear timing belts derived from these.

The standard properties of timing belts can change due to different influences. This is why drives should be checked in conditions that correspond or are as close as possible to future use.

If you have any questions, please take advantage of the free service provided by our application engineers.

TABLE OF CONTENTS

TABLE OF CONTENTS

1 PRODUCT DESCRIPTION

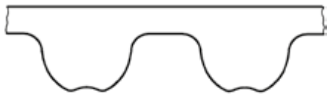
1.1 OPTIBELT PROFILE, DIMENSIONS, AND TOLERANCES

The Optibelt profile is a further development of the HTD profile, that runs more quietly than other timing belt profiles. The optimised tooth shape and indentation in the tooth head of the Optibelt profile allows for significantly lower noise levels. In combination with the newly developed materials, it is possible to reduce noise levels further, even at high rotational speeds and with high pretension.
All timing belts with the Optibelt profile can be used in optibelt ZRS HTD or RPP timing belt pulleys. The profile is based on the ISO 13050 standard. Timing belts with the 2M, 3M and 5M profiles also run in MR timing belt pulleys.

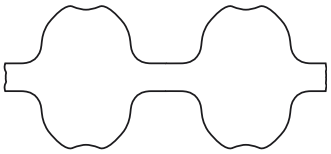
optibelt OMEGA timing belts with double-sided teeth in profiles D5M, D8M, and D14M are available for the implementation of drives with speed reversal. The construction of belts with double-sided teeth is analogous to that of the normal Optibelt profile. Because of the equal tooth design it is possible to choose any load distribution. The maximum admissible nominal power rating can thus be transmitted by both the inside and the outside tooth side alone. If there are several drive pulleys, the load can be distributed indiscriminately on both tooth sides; the sum of the distributed output shall however not exceed the admissible values.

Profiles

2M, 3M, 5M, 8M, 14M



D5M, D8M, D14M



Timing belts in Optibelt profile are manufactured in a wide range of lengths and widths. There are several special lengths, widths and constructions available. Please contact our Optibelt Application Engineering department for more information. Timing belts with the Optibelt profile are manufactured as standard in grinding class G2, height tolerance ± 0.25 mm.

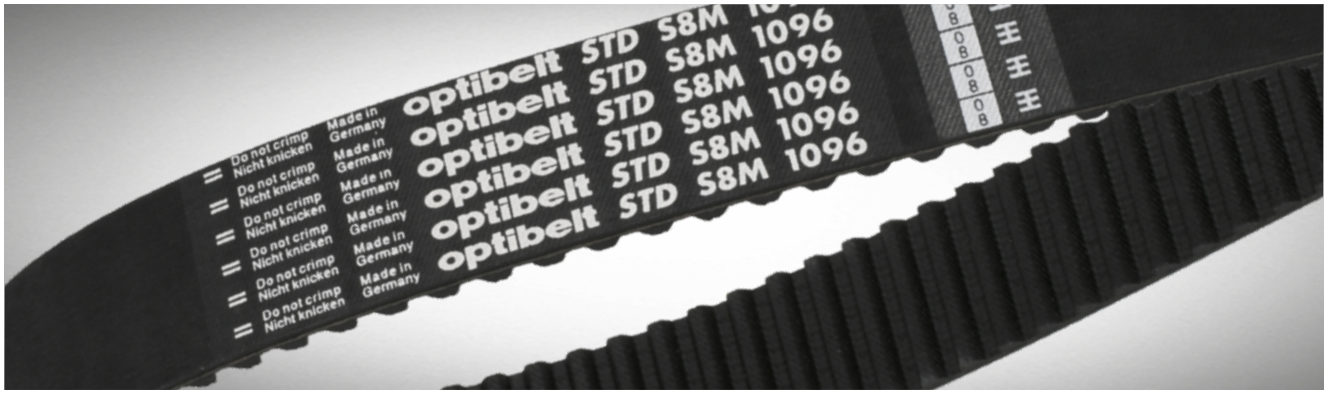
177.9 up to max.	–	–	+ 4.8 – 6.4

1 PRODUCT DESCRIPTION
1.2 STD PROFILE, DIMENSIONS, AND TOLERANCES

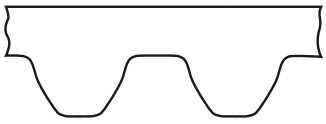


The STD profile has a special tooth form and was inspired by involute toothing, such as in gear wheels. This special tooth form minimises the friction of teeth against the timing belt pulley. This makes it possible to reach considerably lower noise levels as with HTD profile timing belts. The attainable noise level is of the same level as the Optibelt profile. The profile fulfils the requirements of the ISO 13050 standard.

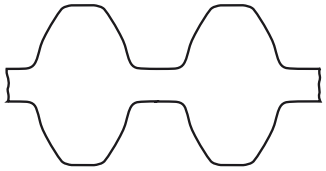
optibelt STD timing belts with double-sided teeth in profile DS8M are available for the implementation of drives with speed reversal. The construction of belts with double-sided teeth is analogous to that of the normal STD profile. Because of the equal tooth design it is possible to choose any load distribution. The maximum admissible nominal power rating can thus be transmitted by both the inside and the outside tooth side alone. If there are several drive pulleys, the load can be distributed indiscriminately on both tooth sides; the sum of the distributed output shall however not exceed the admissible values.

Profiles

S5M, S8M, S14M



DS8M



Timing belts in STD profile are manufactured in a wide range of lengths and widths. There are several special lengths, widths and constructions available. Please contact our Application Engineering department for more information. Timing belts with the STD profile are manufactured as standard in grinding class G2, height tolerance ± 0.25 mm.

1 PRODUCT DESCRIPTION
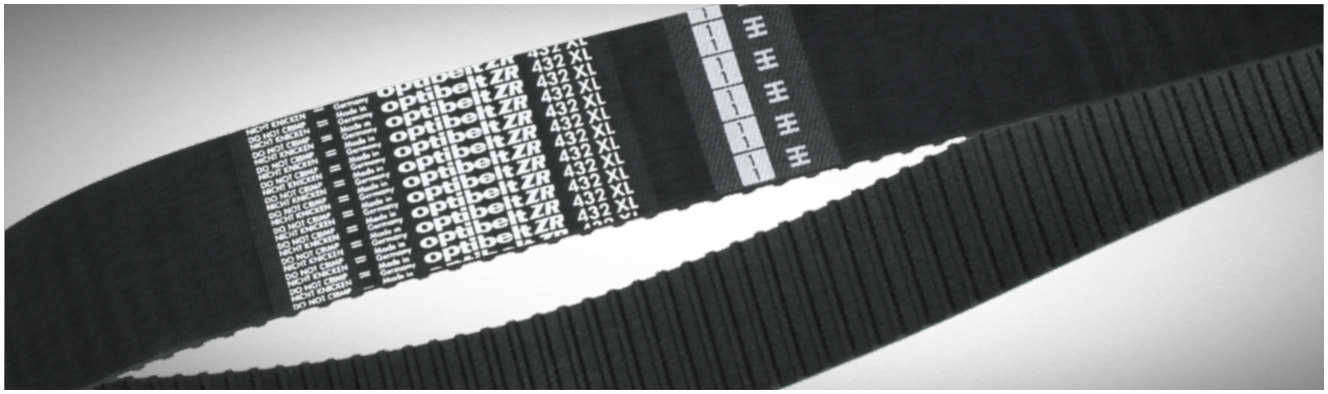
1.3 ZR PROFILE, DIMENSIONS, AND TOLERANCES



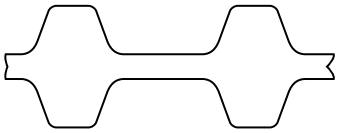
The ZR profile has trapezoidal toothing. Trapezoidal timing belts were first developed in the US. Due to their place of origin, these belts have standard dimensions that are expressed in inches instead of metres.
Considering the higher power ratings of timing belts with the Optibelt profile, it is advised to select these for new configurations. The profile fulfils the requirements of the ISO 19347 standard.

optibelt ZR timing belts with double-sided teeth in profiles DXL, DL, and DH are available for the implementation of drives with speed reversal.
The construction of belts with double-sided teeth is analogous to that of the normal ZR profile. Because of the equal tooth design it is possible to choose any load distribution. The maximum admissible nominal power rating can thus be transmitted by both the inside and the outside tooth side alone. If there are several drive pulleys, the load can be distributed indiscriminately on both tooth sides; the sum of the distributed output shall however not exceed the admissible values.

Profiles

MXL, XL, L, H, XH, XXH

DXL, DL, DH



Timing belts in ZR profile are manufactured in a wide range of lengths and widths. There are several special lengths, widths and constructions available. Please contact our Application Engineering department for more information. Timing belts with the ZR profile are manufactured as standard in grinding class G2, height tolerance ± 0.25 mm.

TOOTH PITCHES, DESIGNATIONS

ZR timing belts pursuant to ISO 19347 are manufactured with six standard tooth pitches. Due to the American origin of this timing belt profile, length units are expressed in “in” (inches). Width and length codes were derived from the corresponding indications in inches.

OMEGA 2 IN 1

PERFECT FIT IN HTD AND RPP

MINIMUM NOISE LEVEL
Lower noise emissions due to special Optibelt tooth shape

MORE EFFICIENT – MORE POWER
Up to 98 % efficiency

TEMPERATURE RESISTANCE
Temperature resistance from –30 °C to +100 °C

MAXIMUM ECONOMY
Maintenance-free

OPTIMAL COMPATIBILITY
Suitable in HTD and RPP pulleys

FLEXIBLE USE
No double stockholding

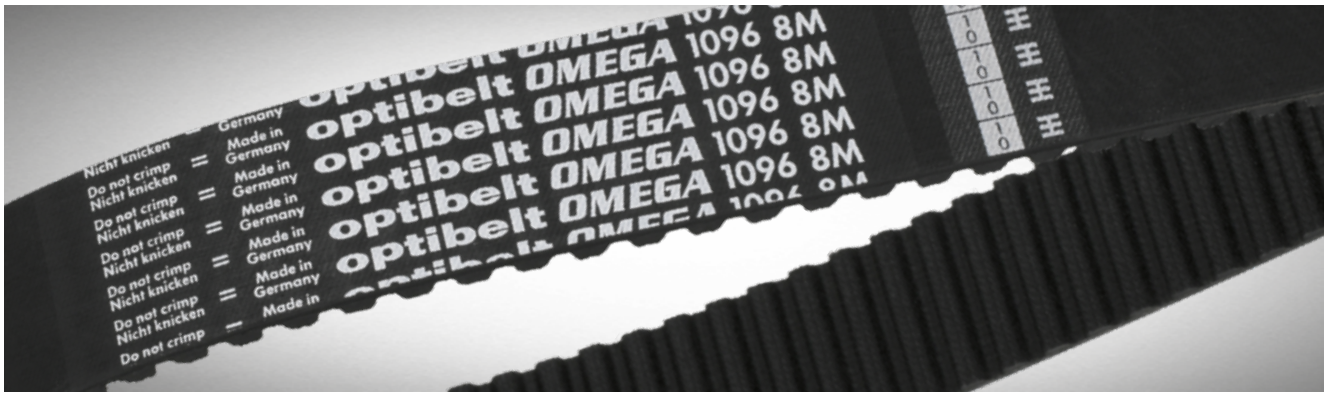
1 PRODUCT DESCRIPTION

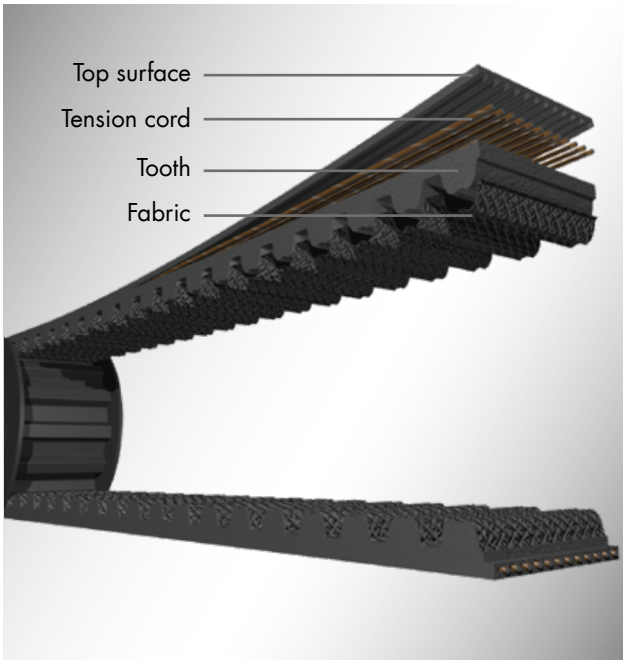
1.4 PRODUCTS IN BASIC DESIGN

optibelt OMEGA TIMING BELT



TOP SURFACE

The belt top surface is made from a flexible polychloroprene rubber compound that protects the tensile member from external influences. It has a limited resistance to mineral oils and humidity. The top surface protects the tension cord from wear and tear due to friction from using a tension idler, etc.



TENSION CORD

The tensile member consists of counter-twisted glass fibres that are helically coiled in pairs and integrated into the belt top surface. The glass fibre tension cord offers high tensile strength and is extremely flexible. The very low elongation ensures that the pitch of the belt corresponds to the pitch of the pulley even under load.

TEETH

Just like the top surface, the teeth are made from a polychloroprene rubber compound. In combination with the fabric on the tooth side, this leads to a high tooth shear strength. The indentation in the tooth enables quiet running.

FABRIC

The polyamide fabric safeguards the tooth from premature wear and prevents fraying. The low friction value also ensures a low operating temperature and reduces noise levels.

The powerful optibelt OMEGA timing belts are the result of consistent further development. The company's wide-ranging experience with its optibelt ZR and optibelt HTD timing belts has been incorporated in this belt generation. Endless optibelt OMEGA timing belts set accents for synchronous power and positioning drives.

ADVANTAGES AND CHARACTERISTICS

- synchronous speed
- highest precision
- perceptibly lower noise level due to the optibelt OMEGA tooth profile
- for use in HTD and RPP timing belt pulleys
- maintenance-free
- temperature resistant from –30 °C to +100 °C
- up to 98 % efficiency

1 PRODUCT DESCRIPTION

1.5 PRODUCTS IN HP DESIGN

optibelt OMEGA HP TIMING BELT

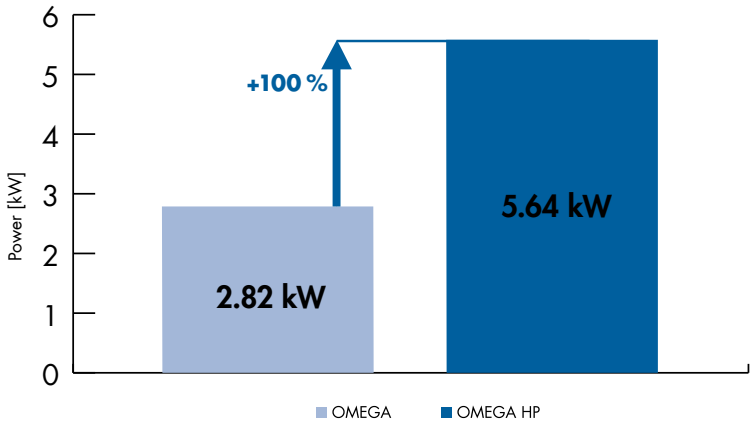
HIGH-PERFORMANCE TIMING BELTS FOR HEAVILY LOADED, FAST RUNNING MACHINE DRIVES WITH SMALL PROFILES

Compact synchronous drives are used throughout the entire spectrum of mechanical drive engineering. A high-performance capacity, good running behaviour and high operational reliability are just some of the requirements placed on timing belts. Modern manufacturing techniques and quality testing in all processing stages ensure products with maximum reliability and a consistently high-quality standard. optibelt OMEGA HP high-performance timing belts have been developed for heavily loaded, fast or slow running drives that are subject to even loading without heavy impacts. The profiles 2M, 3M and 5M in particular greatly surpass the performance of the basic version of the belt.

PERFORMANCE COMPARISON



ADVANTAGES AND CHARACTERISTICS

Due to the combination of a very dimensionally stable structure and good flexibility, very low permanent and elastic elongation of the cord, and a shear-resistant fabric with minimised friction and abrasion, it is possible to achieve the following:

- power transmission is approx. doubled; with the 5M HP profile, power transmission is approx. tripled in comparison with the basic version of the optibelt OMEGA timing belt
- suitable for low and high-speed drives with high dynamic loading
- good resistance during even running, with low and medium impact loading
- broad application spectrum
- electrical conductivity can be verified according to ISO 9563 on request

Since a lot less installation space is required compared to the basic version of the optibelt OMEGA timing belt, the following benefits arise:

- lower costs for belts and pulleys
- greater design freedom when configuring drives
- reduced shaft diameters and smaller bearings
- reduced noise
- improved efficiency

Significant system cost savings and high functional reliability can be obtained along with optimum efficiency in new drives.

The tooth shear strength is enhanced with a strong fabric with good adhesion. The form of the Optibelt profile and the friction-reducing fabric make the teeth comparably quieter when meshing in the tooth gap of the timing belt pulley. The polyamide fabric is also extremely resistant to wear and tear and prevents fraying.

HIGH-PERFORMANCE TIMING BELTS FOR FAN DRIVES IN THE OIL INDUSTRY

Fan drives in the oil industry with medium to high transmission ratios face steep requirements:

- anti-static in accordance with ISO 9563
- optimised for low tooth meshing wear
- long service life
- maintenance-free
- high efficiency
- constant flow of air thanks to synchronous operation
- resistant to external influences such as variations in temperature and moisture

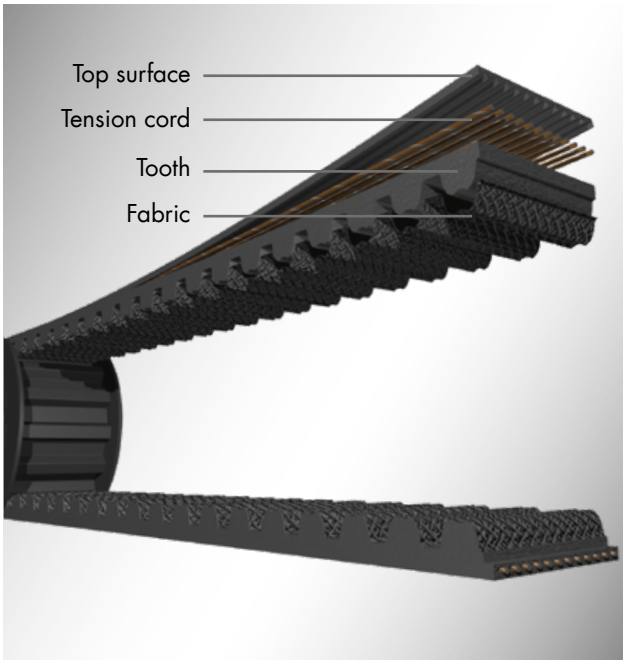
1 PRODUCT DESCRIPTION

1.6 PRODUCTS IN HIGH POWER DESIGN

optibelt OMEGA High Power TIMING BELT

TOP SURFACE

The newly developed polychloroprene rubber compound with a very high proportion of aramid fibre reinforces the belt top surface and protects the tensile member against external influences. It has a limited resistance to mineral oils and humidity. The top surface protects the tension cord from wear and tear due to friction from using a tension idler, etc.



TENSION CORD

The newly developed glass fibre tension cord with even higher adherence offers high tensile strength and is extremely flexible. The tension cord consists of counter-twisted glass fibres that are helically coiled in pairs and integrated into the belt top surface. The very low elongation ensures that the pitch of the belt corresponds to the pitch of the pulley even under load.

TEETH

Just like the top surface, the teeth are made from a newly developed polychloroprene rubber compound reinforced with a particularly high proportion of aramid fibres. In combination with the fabric on the tooth side, this leads to a high tooth shear strength and performance is increased even further.
The indentation in the tooth enables quiet running.

FABRIC

The tooth shear strength is enhanced with a strong coated fabric with very good adhesion. The form of the optibelt profile and the friction-reducing fabric make the teeth comparably quieter when meshing in the tooth gap of the timing belt pulley. The polyamide fabric with the newly developed adherence system is also extremely resistant to wear and tear and prevents fraying.

1 PRODUCT DESCRIPTION

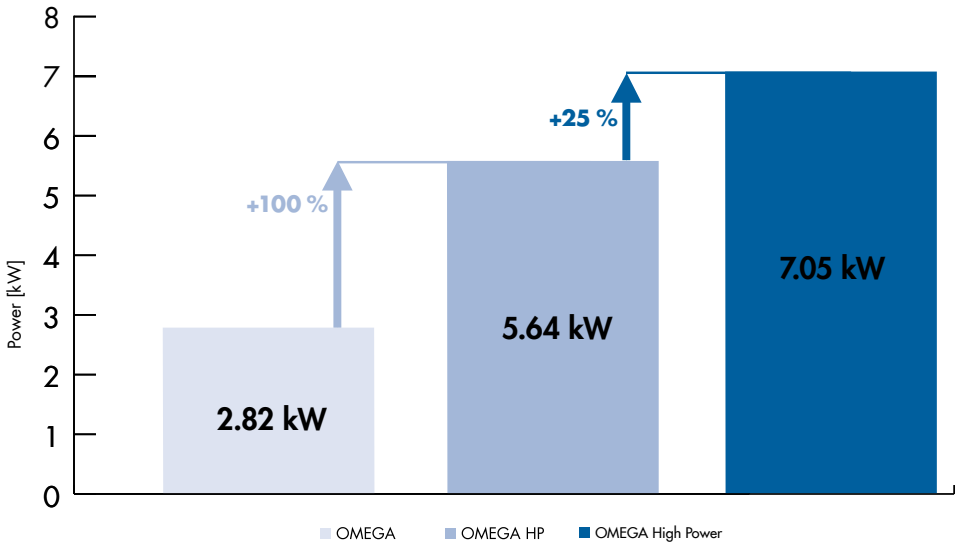
1.6 PRODUCTS IN HIGH POWER DESIGN

optibelt OMEGA High Power TIMING BELT

THE HIGH-PERFORMANCE TIMING BELT FOR HIGH LOAD, FAST-RUNNING MACHINE DRIVES

Compact synchronous drives are used throughout the entire spectrum of mechanical drive engineering. A high-performance capacity, good running behaviour and high operational reliability are just some of the requirements placed on timing belts. Modern manufacturing techniques and quality testing in all processing stages ensure products with maximum reliability and a consistently high-quality standard. optibelt OMEGA High Power high-performance timing belts have been specially developed for very heavily loaded, fast or slow running drives that are subject to even loading without heavy impacts. This extremely high level of performance is based on improved materials and an optimised combination of these materials.

PERFORMANCE COMPARISON



ADVANTAGES AND CHARACTERISTICS

Due to the combination of a very dimensionally stable structure and good flexibility, very low permanent and elastic elongation of the cord, and a shear-resistant fabric with minimised friction and abrasion, it is possible to achieve the following:

- up to 2.5 times the power transmission capacity of the basic OMEGA timing belts, or a performance increase of up to +150 %
- an increase of around 25 % in power transmission compared to the proven high-performance optibelt OMEGA HP
- suitable for low and high-speed drives with high dynamic loading
- good resistance during even running, with low and medium impact loading
- broad application spectrum
- electrical conductivity can be verified according to ISO 9563 on request

Since less installation space is required compared to the optibelt OMEGA HP, and especially compared to the basic version of the optibelt OMEGA timing belt, the following benefits arise:

- lower costs for belts and pulleys
- greater design freedom when configuring drives
- reduced shaft diameters and smaller bearings
- reduced noise
- improved efficiency

Significant system cost savings and high functional reliability can be obtained along with optimum efficiency in new drives.

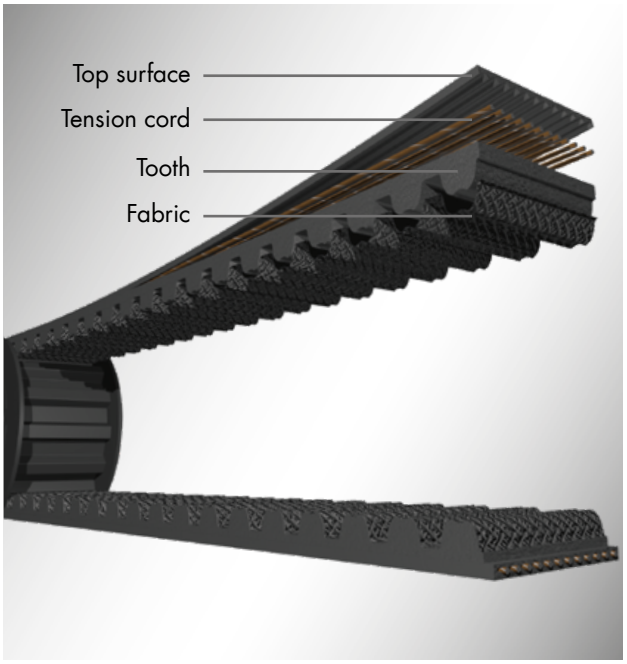
1 PRODUCT DESCRIPTION

1.7 PRODUCTS IN HIGH LOAD DESIGN

optibelt OMEGA High Load TIMING BELT

TOP SURFACE

The newly developed polychloroprene rubber compound with a very high proportion of aramid fibre reinforces the belt top surface and protects the tensile member against external influences. It has a limited resistance to mineral oils and humidity. The top surface protects the tension cord from wear and tear due to friction from using a tension idler, etc.



TENSION CORD

In contrast to optibelt OMEGA High Power, optibelt OMEGA High Load contains a reinforced glass cord. The glass cord provides a higher breaking strength and lower stretch. This increases performance by up to another 30 % in comparison with optibelt OMEGA High Power. The tension cord is particularly resistant against shock loads.

TEETH

Just like the top surface, the teeth are made from a newly developed polychloroprene rubber compound reinforced with a particularly high proportion of aramid fibres. In combination with the fabric on the tooth side, this leads to a high tooth shear strength and performance is increased even further. The indentation in the tooth enables quiet running.

FABRIC

The tooth shear strength is enhanced with a strong coated fabric with very good adhesion. The form of the Optibelt profile and the friction-reducing fabric make the teeth comparably quieter when meshing in the tooth gap of the timing belt pulley. The polyamide fabric with the newly developed adherence system is also extremely resistant to wear and tear and prevents fraying.

1 PRODUCT DESCRIPTION

1.7 PRODUCTS IN HIGH LOAD DESIGN

optibelt OMEGA High Load TIMING BELT

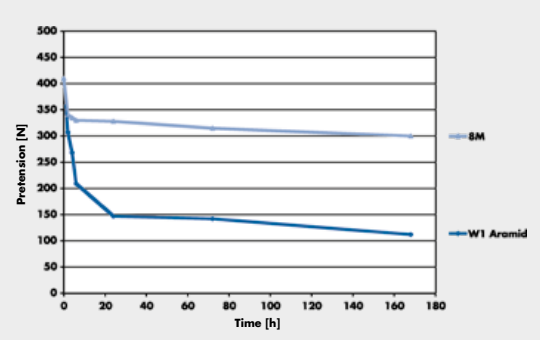
THE HIGH-PERFORMANCE TIMING BELT FOR PARTICULARLY HIGH LOADS ACROSS THE ENTIRE RANGE OF SPEEDS

The optibelt OMEGA High Load with 8M and 14M profiles has been specially designed for drives with high torques and high shock loads. The design and the material of the timing belt have been optimised so that the highest functional reliability and optimum efficiency are achieved when a drive is reconfigured.
The innovative glass cord used in the belt is characterised by the following properties:

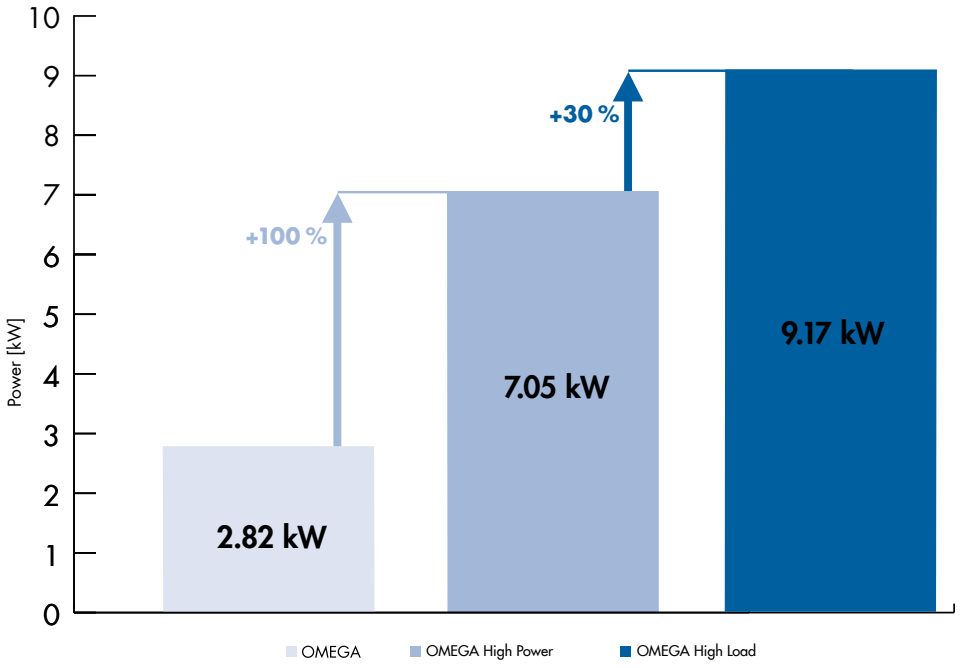
- good resistance to shock loads
- excellent resistance to dynamic loading
- very low permanent and elastic elongation

The diagram opposite shows the advantages of the reinforced glass-fibre tension cord compared to a rival aramid tension cord. The pretensioning loss of the optibelt OMEGA High Load under load is minimal compared to that of the aramid cord. This means that the pitch is maintained and the teeth are evenly loaded. The optibelt OMEGA High Load also demonstrates its strength in the medium and high-speed ranges – which expands its area of application even further.

TENSION LOSS



PERFORMANCE COMPARISON



ADVANTAGES AND CHARACTERISTICS

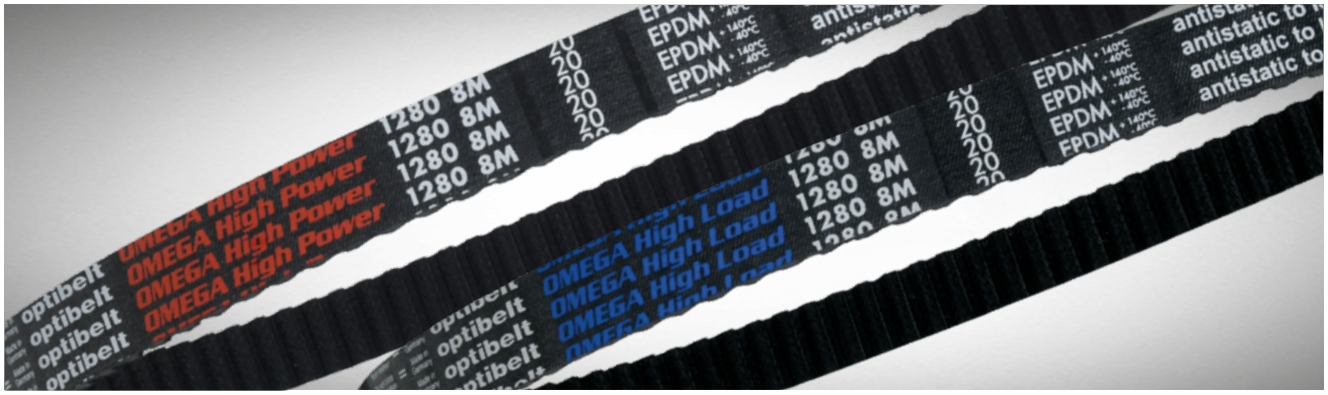
Due to the combination of a very dimensionally stable structure and good flexibility, very low permanent and elastic longation of the cord, and a shear-resistant fabric with minimised friction and abrasion, it is possible to achieve the following:

- up to 3 times the power transmission capacity of the basic OMEGA timing belts, or a performance increase of up to +222 %
- an increase of around 30 % in power transmission compared to the proven high-performance optibelt OMEGA High Power
- suitable for low and high-speed drives with high dynamic loading
- good resistance even to medium and high shock loads

1 PRODUCT DESCRIPTION

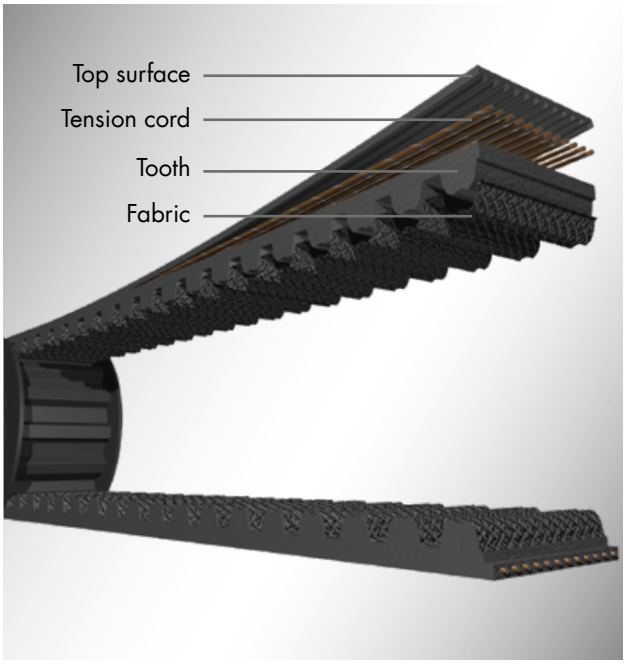
1.8 PRODUCTS IN EPDM DESIGN

optibelt OMEGA High Power/High Load EPDM TIMING BELT



TOP SURFACE

The flexible EPDM rubber compound with a high proportion of aramid fibre reinforces the belt top surface and protects against external influences. It has a limited resistance to humidity.
The top surface protects the tension cord from wear and tear due to friction from using a tension idler, etc. The EPDM material provides very high resistance to cold and heat.



TENSION CORD

The newly developed glass fibre tension cord with even higher adherence offers high tensile strength and is extremely flexible. The tension cord consists of counter-twisted glass fibres that are helically coiled in pairs and integrated into the belt top surface.

In contrast to optibelt OMEGA High Power EPDM, optibelt OMEGA High Load EPDM contains a reinforced glass cord. The glass cord provides a higher breaking strength and lower stretch. The tension cord is particularly resistant against shock loads.

TEETH

Just like the top surface, the teeth are made from a newly developed EPDM rubber compound reinforced with a particularly high proportion of aramid fibres. In combination with the fabric on the tooth side, this leads to a high tooth shear strength and performance is increased even further. The indentation in the tooth enables quiet running.

FABRIC

The tooth shear strength is enhanced with a strong coated fabric with very good adhesion. The form of the Optibelt profile and the friction-reducing fabric make the teeth comparably quieter when meshing in the tooth gap of the timing belt pulley.
The polyamide fabric with the newly developed adherence system is also extremely resistant to wear and tear and prevents fraying.

1.8 PRODUCTS IN EPDM DESIGN

optibelt OMEGA High Power/High Load EPDM TIMING BELT

THE HIGH-PERFORMANCE TIMING BELT FOR AREAS OF APPLICATIONS WITH SPECIAL THERMAL REQUIREMENTS

The optibelt OMEGA High Power EPDM timing belt and the OMEGA High Load EPDM timing belt were specially developed for use in very cold or very hot areas of application. The used EPDM rubber compound makes the belts impervious to temperature ranges from –40 °C to +140 °C. In addition to temperature-specific advantages, they retain the level of performance of High Power or High Load timing belts.

Optibelt timing belts with EPDM rubber compound are available with the following profiles:

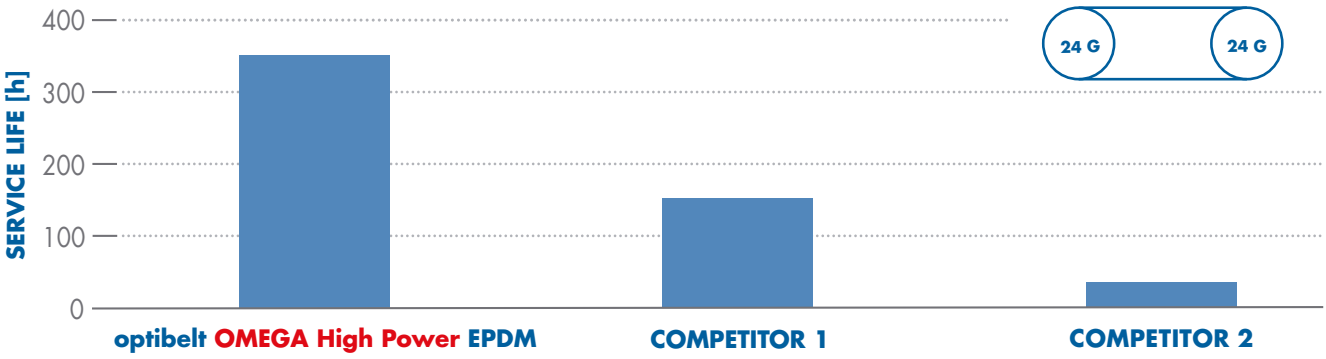
- optibelt OMEGA High Power EPDM with profiles 8M and 14M from a length of 600 mm
- optibelt OMEGA High Load EPDM with profiles 8M and 14M from a length of 600 mm
- shorter lengths available on request. For further information please contact the Optibelt Application Engineering department.

ADVANTAGES AND CHARACTERISTICS

Due to the combination of a very dimensionally stable structure and good flexibility, very low permanent and elastic elongation of the cord, and a shear-resistant fabric with minimised friction and abrasion, it is possible to achieve the following:

- performance analogous to High Power/High Load timing belts in 8M and 14M
- temperature resistant from –40 °C to +140 °C
- very good flexibility even after long periods of standing still at –40 °C, for lower power consumption of the drive motor
- meets ISO 9563 anti-static requirements
- complies with the requirements of RoHS and REACH
- ozone and UV-resistant

optibelt OMEGA High Power EPDM 8M ENDURANCE TEST AT –48 °C



AREAS OF APPLICATION

- train doors and steps in extremely cold areas
- shuttle systems and automatic doors in cold rooms
- fans in the oil and chemical industry in extremely cold areas

TRAIN DOORS

SHUTTLE SYSTEMS

FANS

Upon request, the profile 5M is available in basic design, as well as profiles 8M and 14M in HP design in EPDM.

TIMING BELTS FOR YOUR SOLUTIONS

1 PRODUCT DESCRIPTION
1.11 PROPERTIES AND SPECIAL DESIGNS

Limited resistance to oil, heat, cold, and ozone, as well as limited suitability for tropical climates are standard features of all timing belts. There is no special marking.

SERVICE LIFE

Service life can be further increased thanks to new materials. Performance-enhanced belt designs greatly exceed the attainable service life of basic versions. Example: Dynamic controls with optibelt OMEGA HP provide a service life that is up to 18 times higher than basic timing belts. Service life can however greatly vary depending on use, torque, rotational speed, or external influences.

EFFICIENCY

The specially developed tooth fabric and the flexible belt design result in a virtually friction-free belt drive with an efficiency of up to 98 %.

OIL RESISTANCE

The limited oil resistance prevents the damaging effects of mineral oils and greases, as long as these substances are not in permanent contact with the timing belt and/or are not present in large quantities. If you have higher resistance requirements, e.g. against mineral oils, special constructions can be used to increase the timing belt's area of application. For further information please contact the Optibelt Application Engineering department.

TEMPERATURE RESISTANCE

The timing belt is compatible with ambient temperatures of ≈ –30 °C to +100 °C. Temperatures beyond this range will lead to early aging and embrittlement of timing belts, thus to their early failure. The timing belt's temperature resistance can be extended by special constructions, e.g. by using an EPDM rubber compound, which increases the range to –40 °C to +140 °C. For further information please contact the Optibelt Application Engineering department.

ELECTRICAL CONDUCTIVITY

Electrical conductivity allows the belts to safely discharge electrostatic charges. In timing belts with insufficient electrical conductivity, these charges can be so high that sparking causes a risk of ignition. Electrical conductivity according to ISO 9563 is achieved via special rubber compounds and fabric types. It is established by an acceptance test certificate.

Specific Optibelt timing belts are already anti-static as standard in accordance with ISO 9563 and are marked as follows:

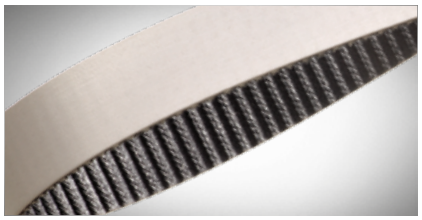
- optibelt OMEGA HP with profiles 8M and 14M
- optibelt OMEGA FAN POWER with profiles 8M and 14M
- optibelt OMEGA High Power with profiles 8M and 14M
- optibelt OMEGA High Load with profiles 8M and 14M
- optibelt OMEGA High Power/High Load EPDM with profiles 8M and 14M

For anti-static properties in other belt versions and/or profiles, please contact the Optibelt Applications Engineering department.

OTHER SPECIAL DESIGNS

In order to fulfil the special requirements of our customers, various special designs can be manufactured, such as:

- special tolerances for width, length and height
- special fabrics
- special cords such as aramide
- special profiles such as T2.5, T5, T10
- special compounds
- reinforced top surface
- top surface coatings
- Mechanical processing



Special rubber compounds, top surface coatings, and mechanical processing give timing belts special properties and allow customers to use them in additional areas of application, such as in conveying technology.

Special coating properties can be used to do so, such as:

- increase or reduction of friction between the belt top surface and the conveyed goods
- protection against wear and tear or damage
- protection of conveyed goods against stains
- high temperature resistance
- special chemical resistance
- damping properties

Coatings applied during the manufacturing process are inextricably joined with the base belt, there are no bonding surface or joints.

Coatings can also be added subsequently on a large number of base belts. We can create coatings that cannot be vulcanised together with the base belt, such as silicone rubber.

Mechanical processing enables the use of timing belts in even further areas of application, e.g.:

- timing belts with bores for vacuum applications
- timing belts with chamfered lateral faces for variator applications
- timing belts with longitudinal and transversal grooves for noise optimisation

For further information please contact the Optibelt Application Engineering department.

2 BASICS OF DRIVE DESIGN
2.1 GENERAL REMARKS

FORCES IN A TWO-PULLEY DRIVE

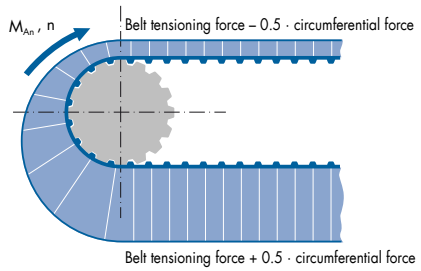
Representing all drive types, the forces in a timing belt drive are described for a drive with two pulleys.

CIRCUMFERENTIAL FORCE

The circumferential force transmitted by the timing belt F_U mainly depends on the load bearing capacity of the teeth and the tensile reinforcements.

The nominal power P_N produced by the tooth loading capacity can be found in chapter Power Ratings.
The rated load bearing capacity primarily depends on the diameter and the rotational speed of the small or, depending on the drive type, the driving pulley. In addition, the type of the external loads and the drive geometry of each individual drive must be taken into account.

TENSILE FORCE DISTRIBUTION IN TIMING BELTS



CENTRIFUGAL FORCES

Growing rotational speeds increase the centrifugal forces of the belt, with the shaft loads decreasing accordingly.
With timing belts, which are comparatively lighter than V-belts, the belt's centrifugal forces are not taken into account for the purpose of simplification.

TOOTH FORCES

Engaging belt teeth transmit the circumferential force from the teeth of the pulley proportionally to the tension cords and vice versa. The load bearing capacity of a tooth is determined by its abrasion and shear strength. The performance of the timing belt can be primarily derived through its width b_r and the sum of the engaging teeth z_e, which is limited for the calculation to a maximum of six teeth. As soon as six teeth and more have meshed on the small pulley, the timing belt's complete performance can be used without any deduction.

TENSION FORCES

The tension cord takes up the circumferential force tooth for tooth at the drive pulley and transmits it. At the driven pulley, the cord releases this circumferential force again through the tooth engagement. In addition, belt tension forces are applied to the tension cord that act in the same way in the spans as well as the areas in contact without an external load as static belt tension.

2 BASICS OF DRIVE DESIGN
2.2 FORMULA SYMBOLS

The table defines the basic parameters and the associated units which are used in the formulas of this Technical Manual.

Formula symbols	Explanation	Unit	Formula symbols	Explanation	Unit
a	Centre distance	mm	i	Transmission ratio	–
a_{nom}	Centre distance with selected belt length	mm	L	Span length	mm
b_r	Belt width	mm	L_{wSt}	Standard pitch length of the timing belt	mm
β	Arc of contact	°	L_{wth}	Calculated pitch length of the timing belt	mm
c_0	Base service factor	–	m_k	Weight per metre per 1 mm of belt width	kg/m
c_1	Teeth in mesh factor	–	n_1	Speed of the driving timing belt pulley	min^{-1}
c_2	Total service factor	–	n_2	Speed of the driven timing belt pulley	min^{-1}
c_3	Speed correction factor	–	n_k	Speed of the small timing belt pulley	min^{-1}
c_6	Fatigue correction factor	–	P	Power to be transmitted from timing belt drive	kW
c_7	Belt length correction factor	–	P_B	Design power	kW
d_a	Outside diameter of timing belt pulley	mm	P_N	Nominal power	kW
d_w	Pitch diameter of timing belt pulley	mm	$P_Ü$	Transmissible power from a standard belt width [P_N * c_1 * c_7]	kW
d_{w1}	Pitch diameter of driving timing belt pulley	mm	t	Tooth pitch	mm
d_{w2}	Pitch diameter of driven timing belt pulley	mm	v	Belt speed	m/s
d_{wg}	Pitch diameter of large timing belt pulley	mm	x	Minimum adjustment of the drive centre distance a_{nom} for tensioning the timing belt	mm
d_{wk}	Pitch diameter of small timing belt pulley	mm	y	Minimum adjustment of the drive centre distance a_{nom} for installation of the timing belt	mm
f	Frequency	Hz	z_1	Number of teeth of the driving timing belt pulley	–
f_{Init}	Frequency, initial installation	N	z_2	Number of teeth of the driven timing belt pulley	–
F_A	Static shaft load	N	z_e	Number of meshed teeth on the small pulley	–
$F_{A\ Init}$	Static shaft load, initial installation	N	z_g	Number of teeth of the large timing belt pulley	–
F_T	Static belt tension	N	z_k	Number of teeth of the small timing belt pulley	–
$F_{T\ Init}$	Static belt tension, initial installation	N	z_r	Number of teeth of the timing belt	–
F_U	Circumferential force	N			

TOTAL SERVICE FACTOR c_2

The total drive service factor c_2 is composed of the base drive service factor c_0 and two further allowances c_3 and c_6.

$c_2 = c_0 + c_3 + c_6$

$c_2 \geq M_A/M_N$ Recommended for frequent starts and stops

BASIC DRIVE SERVICE FACTOR c_0

The basic drive service factor c_0 takes into account the daily operating time and the type of driver and driven units. As it is not possible to summarize any thinkable combination of driver, driven unit and operating conditions in one table, the basic drive service factors are to be considered as guide values. The assignment of the driven unit depends on the type of load that is present in each case. For slowly operating drives with a rotational speed of ≤ 100 min^{-1}, a basic drive service factor of at least 2 is to be recommended.

c_0 Type of base load and examples of a driven machine	Load type and examples of driving machines			
	Continuous running Electric motor Fast-moving turbine Piston machine with high number of cylinders		**Non-continuous running** Hydraulic motor Slow-moving turbine Piston machine with low number of cylinders	
	Basic drive service factor c_0 for daily operating time			
	up to 16 h	above 16 h	up to 16 h	above 16 h
Light drives, joint-free and uniform running Measuring instruments Film cameras Office equipment Belt conveyors (light goods)	1.3	1.4	1.4	1.5
Medium drives, temporary operation with small to medium shock loads Mixing machines Food processors Printing machines Textile machines Packaging machines Belt conveyors (medium goods)	1.6	1.7	1.8	1.9
Heavy drives, operation with medium to strong temporary shock loads Machine tools Wood processing machines Eccentric drive Conveying systems (heavy goods)	1.8	1.9	2.0	2.1
Very heavy drives, operation with strong permanent shock loads Mills Extruders Piston pumps and compressors Lifting gear	2.0	2.1	2.2	2.3

  Back to table of contents

TEETH IN MESH FACTOR c_1

Number of meshed teeth	Tooth meshing factor c_1
≥ 6	1.00
5	0.80
4	0.60
3	0.40
2	0.20

SPEED CORRECTION FACTOR c_3 (for speed increasing drives)

Speed correction i	Speed correction factor c_3
1.00 – 0.80	0.00
0.79 – 0.57	0.10
0.56 – 0.40	0.20
0.39 – 0.28	0.30
0.27 and smaller	0.40

FATIGUE CORRECTION FACTOR c_6

Operating conditions	Fatigue correction factor c_6
Use of tension or idler pulleys	0.20
Operating time 16–24 h	0.20
Only rare or occasional operation	– 0.20

In the event of high switching frequency or of persistent reversing operation, the chosen total drive service factor c_2 should be larger than the ratio between start-up and nominal torque. This should also be applied to the braking torque in case of frequent braking with the motor brake. If you have any questions, please contact the Optibelt Applications Engineering department.

BELT LENGTH FACTOR c_7

FORMULAS

Pitch length of the timing belt

$$L_{wth} \approx 2a + \frac{\pi}{2}(d_{wg} + d_{wk}) + \frac{(d_{wg} - d_{wk})^2}{4\,a}$$

L_{wSt} see standard lengths, see pages 28-66

Centre distance from L_{wSt}

$$a_{nom} = K + \sqrt{K^2 - \frac{(d_{wg} - d_{wk})^2}{8}}$$

$$K = \frac{(L_{wSt})}{4} - \frac{\pi}{8}(d_{wg} + d_{wk})$$

Minimum adjustment for tensioning

$x = 0.004 \cdot a_{nom}$

Minimum adjustment for installation

y = from table, page 74

Number of meshed teeth on the small pulley

$$z_e = \frac{z_k}{6}\left(3 - \frac{d_{wg} - d_{wk}}{a_{nom}}\right)$$

Belt length correction factor

c_7 from table, page 73-74

Tooth meshing factor

c_1 from table, page 73

Belt width over rated power

$P_Ü$ = transmissible power from a standard belt width
$P_Ü = P_N \cdot c_1 \cdot c_7$
P_N value and, if required, width correction factor (which is to be multiplied by the P_N value) see pages 86-113

Required: $P_Ü \geq P_B$

CALCULATION EXAMPLE

$$L_{wth} \approx 2 \cdot 425 + \frac{\pi}{2}(142.60 + 91.67) + \frac{(142.60 - 91.67)^2}{4 \cdot 425}$$

$L_{wth} \approx$ **1219.33 mm**

Nearest standard belt length selected from page 60

$L_{wSt} =$ **1200 mm**

$$a_{nom} = 208 + \sqrt{208^2 - \frac{(142.60 - 91.67)^2}{8}}$$

$a_{nom} =$ **415,22 mm**

$$K = \frac{1200}{4} - \frac{\pi}{8}(142.60 + 91.67) = 208 \text{ mm}$$

$x \geq$ **1.66 mm**

y = **22 mm** (with flanged pulley)

$$z_e = \frac{36}{6}\left(3 - \frac{142.60 - 91.67}{415}\right) = 17.26$$

$z_e =$ **17**

$c_7 =$ **1.0**

$c_1 =$ **1.0**

$P_Ü = 44.84 \cdot 1.0 \cdot 1.0 =$ **44.84 kW**
P_N for 30 mm width = 28.38 · 1.58 = **44.84 kW**

44.84 kW > 39.10 kW **Requirement met!**

Design:

One optibelt OMEGA High Power timing belt	1200 8M 30
One optibelt ZRS HTD timing belt pulley	TB 36 8M 30
One optibelt ZRS HTD timing belt pulley	TB 56 8M 30

The correct level of belt tension is of crucial importance for trouble-free transmission of power, and for achieving an acceptable belt service life. Often, tension which is either too high or too low results in early timing belt failure.

Adjustment of the specified static belt tension, e.g. using the thumbprint method, is not a suitable means of tensioning drives correctly in order to fully utilize them economically. Instead, it is recommended to set the static belt tension by measuring the frequency of a swinging span, e.g. using the measuring equipment from the optibelt TT series.

Correct setting of pretension is crucial:
- to ensure functional safety and with few downtimes
- to obtain the highest possible drive efficiency
- to reach maximum timing belt service life
- to achieve good positioning accuracy
- to incur minimum operating costs (maintenance/replacement)

Effects of too low pretension:
A too lowly pretensed timing belt drive can in principle transmit less power, as there is always a risk of tooth jumping. If the timing belt jumps, it may get overstretched by the unforeseen elongation of the tension cord and rip, or the teeth can shear off due to the shock load. Jumping usually causes the timing belt to fail.

Effects of too high pretension:
A too highly pretensed timing belt drive causes increased wear and tear of the timing belt's tooth base. The wear and tear of the fabric between the teeth will eventually expose the timing belt's tension cord, which will get damaged and cause the belt to fail. Furthermore, excessive pretension increases load on individual teeth, which may be damaged. Moreover, this causes an increase in running noises as well as higher loads on shafts and bearings of the driving and/or driven machine.

CALCULATION OF PRETENSION

The default value for the frequency measurement can be determined using the following formulas:

FORMULA SYMBOLS

b_r	[mm]	Belt width	F_U	[N]	Circumferential force
ß	[°]	Arc of contact	L	[mm]	Span length
f	[Hz]	Frequency	m_k	[kg/m]	Weight per metre per 1 mm of belt width
f_{Init}	[N]	Frequency, initial installation	n_k	[min^{-1}]	Speed of small timing pulley
F_A	[N]	Static shaft load	P_N	[kW]	Nominal power
$F_{A\,Init}$	[N]	Static shaft load, initial installation	t	[mm]	Tooth Pitch
F_T	[N]	Static belt tension	v	[m/s]	Belt speed
$F_{T\,Init}$	[N]	Static belt tension, initial installation	z_k		Number of teeth of small timing pulley

LINEAR BELTS

HIGH POSITIONING PRECISION

MAINTENANCE-FREE

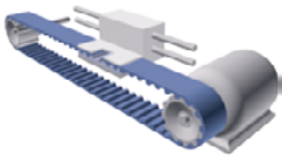
OPEN-ENDED TIMING BELTS

4 LINEAR BELTS RUBBER
4.1 PRODUCT DESCRIPTION

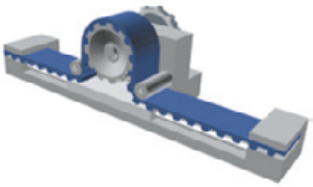
Open-ended Optibelt timing belts made from rubber with OMEGA, STD and ZR profiles are available for the implementation of linear drives.

The main function of linear drives is to convert a rotary movement (rotation) into a straight movement (translation).
We differentiate between two variants:

Linear drives with motor stopped



Linear drives with motor moving



APPLICATION EXAMPLES
- automatic door and gate drives
- incremental encoders for lifts
- linear shifting tables for machine tools
- linear positioning systems

Rubber linear timing belts from Optibelt are available in widths of up to 30 mm depending on the profile; standard roll length of 30 m. Higher positioning precision thanks to the used low-stretch glass cord is achieved.

PROFILES AND VERSIONS
Optibelt rubber linear timing belts are available with the following profiles and versions:
- optibelt OMEGA LINEAR with profiles 3M, 5M and 8M
- optibelt OMEGA HP LINEAR with profiles 3M, 5M and 8M

- optibelt STD LINEAR with profiles S5M and S8M
- optibelt STD HP LINEAR with profile S8M

- optibelt ZR LINEAR with profiles XL, L and H

Other profiles, versions and roll lengths available upon request.

FASTENING WITH CLAMPING PLATES
The timing belt ends of linear drives are primarily fastened using clamping plates. optibelt CP clamping plates included in the standard assortment ensure safe clamping of the timing belts up to the respective breakage limit.

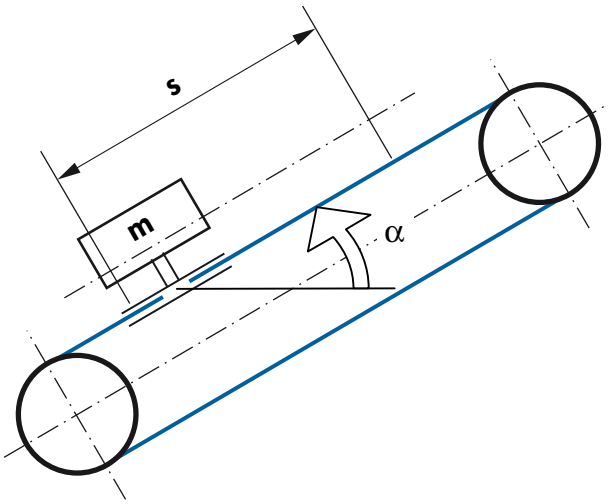
FORMULA SYMBOLS

Formula symbols	Explanation	Unit	Formula symbols	Explanation	Unit
a	Intended drive centre distance	mm	F_H	Lifting or downward force	N
a_1	Acceleration	m/s^2	F_R	Friction force	N
a_2	Deceleration	m/s^2	F_T	Static belt tension	N
a_{nom}	Drive centre distance with selected belt length	mm	F_U	Circumferential force	N
α	Angle of inclination	°	$F_{U\ perm}$	Permissible circumferential force of the timing belt	N
b_r	Belt width	mm	L	Span length	mm
c_0	Base drive service factor	–	L_w	Pitch length of the timing belt	mm
c_2	Total drive service factor	–	m	Mass	kg
$c_{2\ actual}$	Actual drive service factor	–	m_k	Weight per metre per 1 mm of belt width	kg/m
c_6	Fatigue allowance	–	M_N	Drive torque	Nm
d_{max}	Maximum pulley diameter	mm	μ	Friction coefficient of slide guidance	–
$d_{w\ provisional}$	Provisionally selected diameter of timing belt pulleys	mm	n	Rotational speed	1/min
d_{w1}	Pulley diameter pulley 1	mm	P_N	Nominal power of timing belt	kW
d_{w2}	Pulley diameter pulley 2	mm	s	Distance of movement	mm
f	Frequency	Hz	v	Speed of movement	m/s
F_A	Static shaft load	N	z	Number of teeth on timing belt pulley	–
F_{acc}	Acceleration force	N			
F_{BU}	Design circumferential force including c_2	N			

LINEAR CALCULATION

In linear drives, the highest load for timing belts occur during acceleration and deceleration phases. During the movement at constant speed, the load on the belt is the lowest in minimal throughout the motion cycle. Typically, only very low friction forces are at play, and, depending on the arrangement, output or lifting forces may be present. In the following calculation example, a mass "m" is moved back and forth at an inclined angle α to the horizontal.



DRIVE DATA

Driven mass m = 100 kg

Acceleration a_1 = 3 m/s²

Deceleration a_2 = 11 m/s²

Speed of movement v = 4 m/s

Friction coefficient of slide guidance μ = 0.1

Angle of inclination α = 30°

Intended drive centre distance a_a = 2600 mm

Distance of movement s = 2100 mm

Overall height: diameter d_{max} < 150 mm, $d_{w1} = d_{w2}$

Switching operations per day in three-shift operation: approx. 300

CALCULATION METHODS

The drive design is performed through the calculation of the circumferential force F_u. Basis for this are

- the drive torque M_N of the driver machine
- the acceleration and friction forces

If, as in this example, the calculation path is selected via the acceleration and friction forces, the drive machine selected later must be subsequently included in the drive design. The calculation circumferential force F_{BU} takes into account all loads acting in the belt.

FORMULAS

Total drive service factor

$$c_2 = c_0 + c_6 + c_7$$

c_0: medium drive
c_6: no OMEGA drive
c_7: high frequency

Circumferential force from the drive torque

$$F_U = \frac{M_N \cdot 2 \cdot 10^3}{d_w}$$

$$F_{BU} = F_U \cdot c_2$$

CALCULATION EXAMPLE

$c_2 = 1.7 + 0 + 0.3 =$ **2.0**

Circumferential force from the acceleration and friction forces

The acceleration or deceleration at which the highest circumferential force is generated must be taken into account as the basis for the calculation. If the acceleration is greater than the deceleration by 2 * μ * g * cos α, F_R must be added, otherwise subtracted. Case differentiation with test:

$a_2 - a_1 < 2 \cdot \mu \cdot g \cdot \cos\alpha \rightarrow$ acceleration → $F_U = F_{acc} + F_H + F_R$

$a_2 - a_1 \geq 2 \cdot \mu \cdot g \cdot \cos\alpha \rightarrow$ deceleration → $F_U = F_{acc} + F_H - F_R$

$a_2 - a_1$ | $11\ m/s^2 - 3\ m/s^2$ | $= \mathbf{8\ m/s^2}$

$2 \cdot \mu \cdot g \cdot \cos(\alpha)$ | $2 \cdot 0.1 \cdot 9.81\ m/s^2 \cdot \cos30°$ | $= \mathbf{1.669\ m/s^2}$

$8\ m/s^2 > 1.699\ m/s^2$ → **deceleration**

Calculation example: deceleration → $F_U = F_{acc} + F_H - F_R$

$F_U = m \cdot a + m \cdot g \cdot \sin\alpha - \mu \cdot m \cdot g \cdot \cos\alpha$

$F_U = m \cdot (a + g \cdot \sin\alpha - \mu \cdot g \cdot \cos\alpha)$

$F_U = 100\ kg \cdot (11\ m/s^2 + 9.81\ m/s^2 \cdot \sin30° - 0.1 \cdot 9.81\ m/s^2 \cdot \cos30°)$

$F_U = \mathbf{1505.5\ N}$

$= \mathbf{3011\ N}$

$F_{BU} = F_U \cdot c_2$ | $F_{BU} = 1505.5\ N \cdot 2.0$

Calculation of the pulley diameter

Provisional diameter of timing belt pulley selected: $d_{w\ provisional} = 100$ mm

$z = \frac{d_{w\ provisional} \cdot \pi}{t}$ | $z = \frac{100\ mm \cdot \pi}{8\ mm}$

$z = \mathbf{39.27\ mm}$ → The next largest standard tooth number is selected: $z = \mathbf{40\ mm}$

$d_w = \frac{z_1 \cdot t}{\pi}$ | $d_w = \frac{40 \cdot 8\ mm}{\pi}$ | $= \mathbf{101.86\ mm}$

Calculation of rotational speed

$n = \frac{19100 \cdot v}{d_w}$ | $n = \frac{19100 \cdot 4m/s}{101.86\ mm} = 750.05\ 1/min$

Preselection from the diagram

$F_{BU} = 3011$ N

$n = 750.05\ 1/min$

→ Profile and version 8MHP

Exact calculation

Power rating P_N from table, page 107, for 40 teeth, 750 1/min, width 30 mm

No power rating available for 750 1/min → average value approx. 8 kW · 1.58 ~ P_N = **12.64 kW**

$F_{U\ perm}$ = Permissible circumferential force of the timing belt

$$F_{U\ perm} = \frac{P_N \cdot 19.1 \cdot 10^6}{d_w \cdot n} \qquad F_{U\ perm} = \frac{12.64\ kW \cdot 19.1 \cdot 10^6}{101.86\ mm \cdot 750.05\ 1/min} = \mathbf{3160\ N}$$

$F_{BU} < F_{U\ perm}$ $\qquad$ F_{BU} = 3011 N < $F_{U\ perm}$ = 3160 N → Requirement met!

$c_{2\ actual} = F_{U\ perm} / F_U$ $\qquad$ $c_{2\ actual}$ = 3160 N/1505.5 N = **2.10 N**

STATIC SHAFT LOAD – INITIAL INSTALLATION

$F_{A\ Init} = 1.1 \cdot 1.15 \cdot F_U$ $\qquad$ $F_{A\ Init} = 1.1 \cdot 1.15 \cdot 1505.50\ N$ = **1904.46 N**

STATIC SHAFT LOAD – USED

$F_A = 1{,}1 \cdot F_U$ $\qquad$ $F_A = 1{,}1 \cdot 1505{,}50\ N$ = **1656.05 N**

STATIC BELT TENSION – INITIAL INSTALLATION

$$F_{T\ Init} = \frac{F_{A\ Init}}{2} \qquad F_{T\ Init} = \frac{1904.46\ N}{2} = \mathbf{952.23\ N}$$

STATIC BELT TENSION – USED

$$F_T = \frac{F_A}{2} \qquad F_T = \frac{1656.05\ N}{2} = \mathbf{828.03\ N}$$

FREQUENCY – INITIAL INSTALLATION

For a selected span length of L = 1000 mm:

$$f_{Init} = \sqrt{\frac{F_{T\ Init} \cdot 10^6}{4 \cdot m_k \cdot b_r \cdot L^2}} \qquad f_{Init} = \sqrt{\frac{952.23\ N \cdot 10^6}{4 \cdot 0.0058\ \frac{kg}{m \cdot mm} \cdot 30\ mm \cdot (1000\ mm)^2}} = \mathbf{36.99\ Hz}$$

FREQUENCY – USED

For a selected span length of L = 1000 mm:

$$f = \sqrt{\frac{F_T \cdot 10^6}{4 \cdot m_k \cdot b_r \cdot L^2}} \qquad f = \sqrt{\frac{828.03\ N \cdot 10^6}{4 \cdot 0.0058\ \frac{kg}{m \cdot mm} \cdot 30\ mm \cdot (1000\ mm)^2}} = \mathbf{34.49\ Hz}$$

LENGTH CALCULATION

$L_w = 2 \cdot a + z \cdot t$ $\qquad$ $L_w = 2 \cdot 2600\ mm + 40 \cdot 8\ mm$ = **5520 mm**

  Back to table of contents

FINAL SELECTION

The following components are used for the implementation of the drive:

- an optibelt OMEGA 8MHP 30 timing belt with a length of 5520 mm
- two timing belt pulleys ZRS HTD TB 40 8M 30

METAL

DRIVE PULLEYS

Drive pulleys for force or form-fit connections as well as fastening elements in all common profiles and materials – V-grooved pulleys, V-ribbed pulleys, timing belt pulleys, taper bushes, clamping plates for timing belts, clamping bushings and elastic couplings.

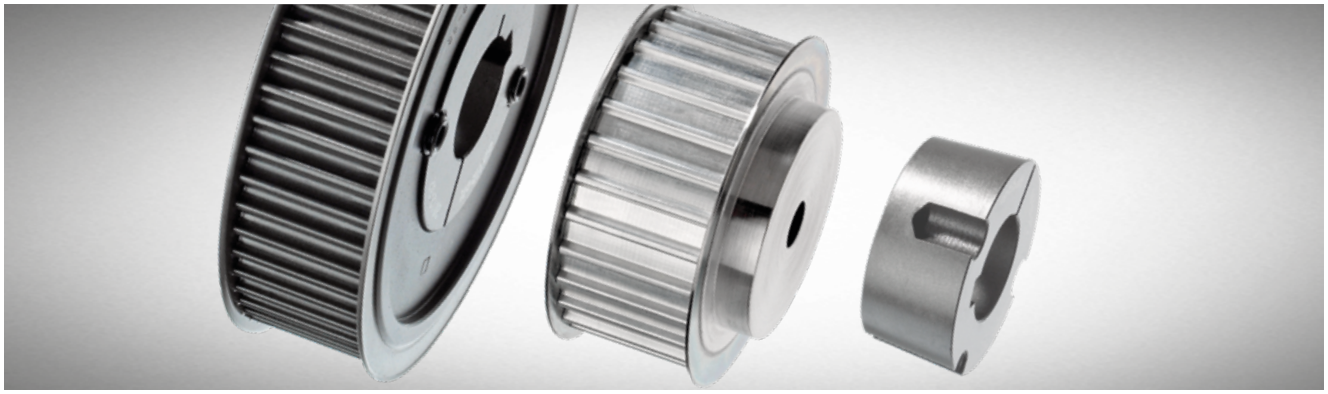
CAD SERVICE TOOL

All information on our metal products, CAD data in all common formats, 3D models, as well as associated product data sheets can be found in our CAD Service Tool on our homepage.

Simply navigate to your desired product and complete the free registration process before the first download. You can then directly log in via our service partner CADENAS.

5 TIMING BELT PULLEYS

5.1 optibelt ZRS HTD TIMING BELT PULLEYS DIMENSIONS AND TOLERANCES



Optibelt timing belt pulleys are available in a wide range. A basic distinction is made between standard and special pulleys. The use of Optibelt timing belt pulleys from the standard range minimises costs and delivery times.

PROFILES

Standard timing belt pulleys are available with the following profiles:

- optibelt ZRS HTD with profiles 3M, 5M, 8M and 14M
- optibelt ZRS in inches with profiles XL, L, H and XH

Timing belt pulleys are manufactured with high pitch precision using a gear hobbing process in accordance with ISO 13050 and ISO 19347 standards. The distance between two neighbouring tooth space centres defines the pitch of the timing belt pulley. This is measured at the pitch diameter which always lies outside of the external diameter of the timing belt pulley and coincides with the timing belt pitch line. This precise manufacturing process allows for minimum backlash and precise tooth engagement.

VERSIONS

Standard timing belt pulleys are available from stock in the following versions:

- with cylindrical pre-boring/centering bore
- with optibelt TB taper bush

The Optibelt product range list includes the corresponding designs, drawings and dimensions of the standard timing belt pulleys. In addition, CAD data is available for standard timing belt pulleys in the common file formats. These are available on the internet at www.optibelt.com.

Depending on the version of standard timing belt pulleys, these are made from aluminium, steel or grey cast iron.

SPECIAL CONSTRUCTIONS

If the use of standard timing belt pulleys is not possible for design reasons, due to specific application requirements or as a result of environmental influences, special timing belt pulleys can be supplied on request in accordance with the drawings or descriptions. Standard timing belt pulleys with subsequently drilled finish bore with the tolerance field e.g. H7 and groove, e. g. as per DIN 6885 Part 1 are also considered as special pulleys.

Other materials such as plastic, sintered metal or die-cast are also available upon request for special applications.

5 TIMING BELT PULLEYS

5.1 optibelt ZRS HTD TIMING BELT PULLEYS DIMENSIONS AND TOLERANCES

PERMISSIBLE DEVIATION IN TOOTH PITCH

The permissible deviations in the tooth pitch between two consecutive teeth, and of the sum of deviations within a 90° arc, are indicated in the following table. These tolerances are the distance between the equivalent points on the right or left side of successive teeth.

Outside diameter d_a [mm]	Permissible deviation of the tooth spacing [mm]	
	between two consecutive teeth	Sum within a 90° arc
≤ 25	0.03	0.06
> 25 ≤ 50	0.03	0.09
> 50 ≤ 100	0.03	0.10
> 100 ≤ 175	0.03	0.13
> 175 ≤ 300	0.03	0.15
> 300 ≤ 500	0.03	0.18
> 500	0.03	0.20

PERMISSIBLE DEVIATIONS OF THE OUTSIDE DIAMETER

Outside diameter d_a [mm]	Permissible deviation [mm]
≤ 25	+ 0.05
> 25 ≤ 50	+ 0.07
> 50 ≤ 100	+ 0.10
> 100 ≤ 175	+ 0.13
> 175 ≤ 300	+ 0.15
> 300 ≤ 500	+ 0.18
> 500	+ 0.20

PULLEY WIDTH

Profile	Pulley width designation [mm]	Pulley nominal width [mm]	Smallest pulley width	
			with flanges b_f* [mm]	without flanges b [mm]
3 M	6 9 15	6 9 15	7 10 17	9 12 19
5 M	9 15 25	9 15 25	10 17 27	12 19 29
8 M	20 30 50 85	20 30 50 85	22 34 54 90	26 38 58 94
14 M	40 55 85 115 170	40 55 85 115 170	47 63 95 126 180	54 70 102 133 187

*b_f = pulley width between the flanges

NOTE

The minimum width b for pulleys without flanges can be reduced if there is no side wobble or run out; however, it may not fall below the minimum width b_f for pulleys with flanges.

5 TIMING BELT PULLEYS

5.1 optibelt ZRS HTD TIMING BELT PULLEYS DIMENSIONS AND TOLERANCES

AXIAL RUN-OUT TOLERANCE

Outside diameter [mm]	Maximum total variation [mm]
≤ 100	0.10
> 100 ≤ 250	0.01 mm per 10 mm outside diameter
> 250	0.25 mm + 0.0005 mm per mm outside diameter above 250.00 mm

TOLERANCE OF ECCENTRICITY

Outside diameter [mm]	Maximum total variation [mm]
≤ 200	0.10
> 200	0.0005 mm per 10 mm outside diameter, however not larger than the outside diameter tolerance

PARALLELISM

The teeth should be parallel to the centre of the bore with a maximum deviation of 0.001 mm per millimetre of width.

CONICITY

The conicity must not be higher than 0.001 mm per millimetre of the width of the driving face and must not exceed the permissible outside diameter tolerance.

BALANCING

For timing belt pulleys processed on all sides (e.g. steel pulleys), no balancing is usually necessary up to a circumferential speed of 30 m/s. All cast pulleys are in principle statically balanced according to G16.

The following general rules apply:

- Balancing on one level. Quality grade Q 16 according to VDI 2060
  - at v = 30 m/s for d_w > 400 mm or
  - at n = 1500 1/min for d_w ≤ 400 mm
- Balancing on two levels according to recommendation Q 6.3
  - at v > 30 m/s or
  - at v > 20 m/s for a ratio between pitch diameter and timing belt pulley < 4

Balancing takes place on unused timing belt pulleys on a smooth balancing mandrel. Please refer to ISO 254 and VDI 2060 for further details. Balancing is only performed upon special request.

MINIMUM PULLEY DIAMETER

Profile	Minimum number of teeth	Minimum pulley diameter [mm]	Minimum diameter of a smooth backside idler [mm]*
2M	10	6.37	8.00
3M	10	9.55	12.00
5M	14	22.28	25.00
D5M	14	22.28	25.00
8M	22	56.02	60.00
D8M	22	56.02	60.00
14M	28	124.78	130.00
D14M	28	124.78	130.00

* The use of a backside idler can reduce the service life of the timing belt.

TIMING BELTS FOR YOUR SOLUTIONS

CAD SERVICE TOOL

5 TIMING BELT PULLEYS

5.2 optibelt ZRS IMPERIAL TIMING BELT PULLEYS DIMENSIONSAN D TOLERANCES

PERMISSIBLE DEVIATION IN TOOTH PITCH

The permissible deviations in the tooth pitch between two consecutive teeth, and of the sum of deviations within a 90° arc, are indicated in the following table. These tolerances are the distance between the equivalent points on the right or left side of successive teeth.

Outside diameter d_a [mm]	Permissible deviation of the tooth spacing [mm]	
	between two consecutive teeth [mm]	Sum within a 90° arc [mm]
≤ 25.40	0.03	0.05
> 25.40 ≤ 50.80	0.03	0.08
> 50.80 ≤ 101.60	0.03	0.10
> 101.60 ≤ 177.80	0.03	0.13
> 177.80 ≤ 304.80	0.03	0.15
> 304.80 ≤ 508.00	0.03	0.18
> 508.00	0.03	0.20

PERMISSIBLE DEVIATIONS OF THE OUTSIDE DIAMETER

Outside diameter d_a [mm]	Permissible deviation [mm]
≤ 25.40	+ 0.05
> 25.40 ≤ 50.80	+ 0.08
> 50.80 ≤ 101.60	+ 0.10
> 101.60 ≤ 177.80	+ 0.13
> 177.80 ≤ 304.80	+ 0.15
> 304.80 ≤ 508.00	+ 0.18
> 508.00	+ 0.20

PULLEY WIDTH

Profile	Pulley width designation	Pulley nominal width [mm]	Smallest pulley width

*b_f = pulley width between the flanges

5 TIMING BELT PULLEYS

5.2 optibelt ZRS IMPERIAL TIMING BELT PULLEYS DIMENSIONS AND TOLERANCES

SIDE WOBBLE TOLERANCE

Outside diameter d_a [mm]	Maximum total variation [mm]
≤ 101.60	0.10 mm
> 101.60 ≤ 254.00	0.01 mm per 10 mm outside diameter
> 254.00	0.25 mm + 0.0005 mm per mm outside diameter above 254.00 mm

RUN OUT TOLERANCE

Outside diameter d_a [mm]	Maximum total variation [mm]
≤ 203.20	0.13 mm
> 203.20	0.13 mm + 0.0005 mm per mm outside diameter above 203.20 mm

PARALLELISM

The teeth should be parallel to the centre of the bore with a maximum deviation of 0.001 mm per millimetre of width.

CONICITY

The conicity must not be higher than 0.001 mm per millimetre of the head width and must not exceed the permissible outside diameter tolerance.

BALANCING

For timing belt pulleys processed on all sides (e.g. steel pulleys), no balancing is usually necessary up to a circumferential speed of 30 m/s. All cast pulleys are in principle statically balanced according to G16.

The following general rules apply:

- Balancing on one level. Quality grade Q 16 according to VDI 2060
  - at v = 30 m/s for d_w > 400 mm or
  - at n = 1500 1/min for d_w ≤ 400 mm
- Balancing on two levels according to recommendation Q 6.3
  - at v > 30 m/s or
  - at v > 20 m/s for a ratio between pitch diameter and timing belt pulley < 4

Balancing takes place on unused timing belt pulleys on a smooth balancing mandrel. Please refer to ISO 254 and VDI 2060 for further details. Balancing is only performed upon special request.

MINIMUM PULLEY DIAMETER

Profile	Minimum number of teeth	Minimum pulley diameter [mm]	Minimum diameter of a smooth idler [mm]
MXL	10	6.47	10.00
XL	10	16.17	20.00
L	10	30.32	30.00
H	14	56.60	60.00
XH	18	127.34	130.00
XXH	18	181.91	190.00

* The use of a backside idler can reduce the service life of the timing belt.

Light or heavy start-up and light to medium shock loads	2.5
Light or heavy start-up and heavy shock loads	3.0

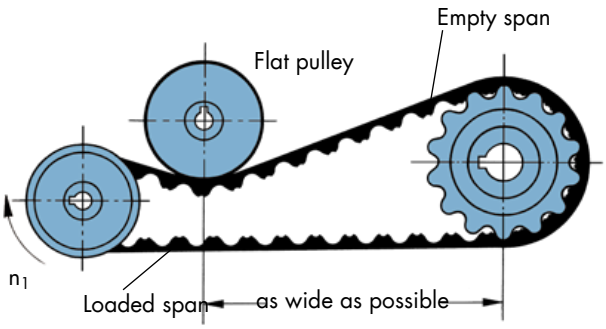
6 DESIGN TIPS
6.1 FLANGES/TENSION IDLERS

FLANGES
To guide Optibelt timing belts, timing belt pulleys must be provided with flanges on one or both sides.
For drive centre distances a > 8 d_w, both timing belt pulleys are to be equipped with flanges on both sides.
We recommend the use of standard timing belt pulleys. If this is not possible for design reasons, corresponding special timing belt pulley designs can be used.

TENSION IDLERS
Idlers are timing belt or flat pulleys that do not transmit power within a drive system. Because they create additional ending stresses within the belt, they should be used according to the following guidelines:
- Diameter of the tension idlers ≥ the smallest permitted pulley according to the profile
- Width of the tension idlers ≥ the timing belt pulleys present in the drive
- Always position tension idlers in the slack side
- Inside idlers:
  ≤ 40 teeth always use timing belt pulley
  > 40 teeth flat pulley possible
- As outside idlers, flat pulleys are to be used in general, as they run on the top surface of the belt
- Flat pulleys must not be of spherical shape
- The tension idlers must be attached in such a way that as many teeth as possible are meshed on the small pulley
- The arc of contact at the idler must be kept as low as possible

MAXIMUM TIMING BELT WIDTH
The maximum timing belt width should not be larger than the diameter of the smallest timing belt pulley present in the drive.

OUTSIDE TENSION IDLER



INSIDE IDLER

6 DESIGN TIPS
6.2 INSTALLATION AND MAINTENANCE

SAFETY INFORMATION

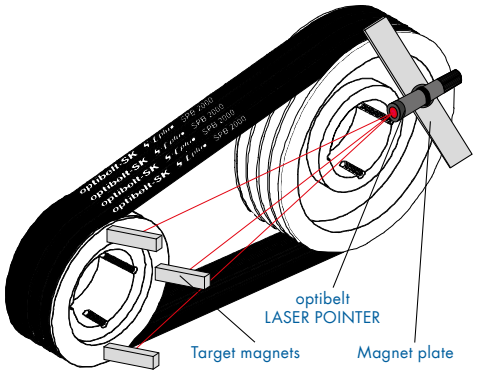
Geometrically correct designing and power rating of drives with Optibelt timing belts ensures long belt service life and a high degree of operating safety.
Practice has shown that premature failure can very often be traced to faulty installation or maintenance. To prevent this, we recommend that you observe the following instructions:

- **Timing belt pulleys**
  The teeth must be manufactured according to standard and also be clean.

- **Alignment**
  Shafts and pulleys should be correctly aligned prior to belt installation.

Maximum deviations of shaft parallelism:

Belt widths [mm]	Angular misalignment
≤ 25	± 1°
> 25 ≤ 50	± 0,5°
> 50 ≤ 100	± 0,25°
> 100	± 0,15°



CORRECT

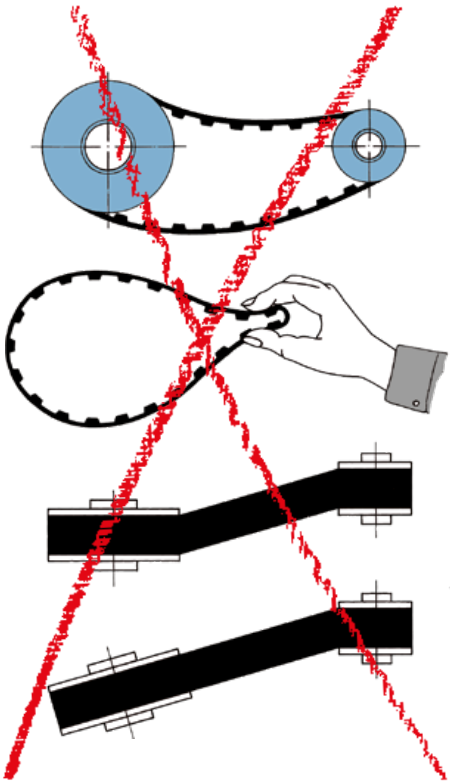
- **Timing belt sets**
  Timing belts which run in pairs or groups on one drive must always be ordered as a set. This guarantees that all belts originate from the same sleeve and are identical in length.

- **Installation**
  Prior to installation, the drive centre distance must be reduced to enable the timing belt to be fitted easily. If this is not possible, the timing belt must be installed together with one or both timing belt pulleys. Forcing belts over the pulley flanges must be avoided as the damage this causes to the high-quality low-stretch tension members is often not visible.
  If taper bushes are used, the studs used should be checked after an operating time of 0.5 to 1 hour with the aid of a torque spanner. Tightening torques see page 169.

- **Pretension**
  The pretension must correspond to the guidelines on page 82. Further inspections after installation are not necessary.

- **Tension idlers**
  Tension idlers are to be avoided. If this is not possible, refer to the recommendations on page 170 of this manual.

- **Maintenance**
  Optibelt timing belts are maintenance-free if used under normal ambient conditions.



INCORRECT

Problem	Cause	Remedy
Heavy wear on the loaded tooth faces of the belt	Incorrect belt tension Pitch error Overload	Correct the tension Check profile and replace, if necessary Use wider belts with higher transmission power
Excessive wear between the teeth of the belt	Excessive belt tension Drive too weakly designed Faulty timing belt pulleys	Reduce tension Enlarge timing belts or pulleys Replace timing belt pulleys
Unusual wear on belt edges	Improper drive centre parallelism Faulty flanges Change of drive centre distance	Realign the shafts Replace the flanges Reinforce bearing or housing
Belt teeth shearing off	Number of meshed teeth too low Overload	Increase the diameter of the small pulley or choose wider belts Use wider belt or larger pulleys
Excessive lateral belt movement	Improper drive centre parallelism Timing belt pulleys are not aligned Shock loads with too high belt tension	Realign the shafts Align the pulleys Reduce belt tension
Detachment of flanges	Timing belt pulleys not in line Very high lateral pressure of the timing belt Incorrect flange installation	Realign the timing belt pulleys Realign the shafts Install flanges correctly
Apparent belt stretch	Incorrect storage	Correct the belt tension, reinforce and secure bearing
Excessive running noise	Incorrect shaft alignment Belt tension too high Pulley diameter too small Overloading of timing belt Belt width too wide with high speed	Realign the shafts Reduce the tension Increase pulley diameter Increase belt width or tooth meshing Reduce belt width by selecting larger belt types
Abnormal wear of timing belt pulleys	Unsuitable material Incorrect tooth meshing Insufficient surface hardness	Use stronger material Replace timing belt pulleys Use harder material or harden surface
Embrittlement of the belt top surface	Ambiant temperature of more than +100 °C Incompatible radiation	Choose extra heat resistant quality Shield from the media or use a suitable belt quality
Cracks on belt top surface	Ambient temperatures below –30 °C	Use extra cold resistant belt quality
Softening of the belt top surface	Influence of incompatible media	Shield from the media or use a suitable belt quality

  Back to table of contents

- **Storage length**
  Properly stored drive belts retain their quality and properties for a period of up to 6 years if the following conditions are met.
  Under unfavorable storage conditions and improper handling, however, most rubber products change their physical properties.

- **Storage area**
  The storage area should be dry and dust-free. Drive belts must not be stored together with chemicals, solvents, fuels, lubricants, acids, etc.

- **Temperature**
  Drive belts should be stored at temperatures between +15 °C and +25 °C. Lower temperatures usually have no negative effect on the drive belts. However, since belts may become very rigid at low temperatures, they should be warmed to approximately +20 °C before installation and use to avoid breaking and cracking. Radiators and supply pipes must be shielded. Drive belts should be stored at least 1 metre away from heat sources.

- **Light**
  Drive belts should be protected from light, especially direct sunlight and strong artificial light with high ultraviolet radiation (ozone formation) such as naked fluorescent tubes. The use of suitable room lighting is advisable.

- **Ozone**
  To counteract the damaging influence of ozone, the storage rooms should not contain any ozone-generating equipment, such as fluorescent light sources, mercury vapor lamps or high-voltage electrical appliances. Combustion gases and vapors that can lead to ozone formation through photochemical processes should be avoided or eliminated.

- **Moisture**
  Damp storage rooms should be avoided. Condensation should not be able to form. The relative humidity is best below 65 %.

- **Proper storage**
  Care should be taken to ensure that drive belts are stored free of tension, i.e. without tension, pressure or other deformation, as tension promotes both permanent deformation and the formation of cracks. If drive belts are stored horizontally on top of each other, it is advisable not to exceed a stack height of 300 mm so that no permanent deformation occurs. If drive belts are stored hanging for space reasons, the diameter of the mandrel should be at least equal to the smallest permissible pulley diameter.

- **Cleaning**
  Dirty rubber drive belts can be cleaned with a mixture of glycerine and spirits in a ratio of 1:10, or brake cleaner. Petrol, benzene, turpentine etc. should not be used. Furthermore, sharp-edged objects such as wire brushes, sandpaper etc. must not be used under any circumstances in order to prevent mechanical damage.

- **Reference to standards**
  Further information can be found in DIN 7716.

ISO 5288 – Vocabulary from Timing Belt Drives
ISO 5289 – Endless Double Sided V-belts and Pulleys for Agricultural Machinery
ISO 5290 – Grooved Pulleys for Joined Narrow V-Belts; Profiles: 9J; 15J; 20J; 25J
ISO 5291 – Grooved Pulleys for Joined Classic V-Belts; Profiles: AJ; BJ; CJ; DJ
ISO 5292 – Industrial V-Belt Drives; Calculations of the Performance Data and Centre Distance
ISO 5294 – Synchronous Belt Drives; Pulleys – "Inch Pitch"
ISO 5295 – Timing Belts; Calculations of the Performance Data and Centre Distance – "Inch Pitch"
ISO 5296 – Synchronous Belt Drives; Belts – "Inch Pitch"
ISO 8370-1 – Dynamic Test to Determine Pitch Zone Location with V-Belts
ISO 8370-2 – Dynamic Test to Determine Pitch Zone Location with V-Ribbed Belts
ISO/DIS 8419 – Belt Drives; Joined Narrow V-Belts; Lengths in Effective System; 9N/J, 15N/J, 25N/J
ISO 9011 – Synchronous Belt Drives – Automotive Pulleys
ISO 9563 – Antistatic Endless Synchronous Belts; Electrical Conductivity; Characteristics and Testing Method
ISO 9980 – Belt Drives; V-Belt Pulleys, Geometric Inspection of Grooves
ISO 9981 – Belt Drives – Pulleys and V-Ribbed Belts for the Automotive Industry; PK Profile
ISO 9982 – Belt Drives; Pulleys and V-Ribbed Belts for Industrial Requirements; Geometric Data PH, PJ, PK, PL, PM
ISO 11749 – Belt Drives - V-Ribbed Belts for the Automotive Industry, Fatigue Testing
ISO 12046 – Synchronous Belt Drives – Automotive Belts – Physical Characteristics
ISO/CD 13050 – Synchronous Belt Drives, Curvilinear Timing Belts
ISO/CD 17396 – Synchronous Belts Drives, Metric Pitch, Profiles T and AT
ISO 21342 – Synchronous Belt Drives – Automotive Belts

6 DESIGN TIPS

6.6 DATA SHEET FOR CALCULATION / CHECKING OF TIMING BELT DRIVES

Company: _____

Street/PO Box: _____

Town or city/Post code: _____

Contact person: _____

Department: _____ Date: _____

Tel.: _____ Fax: _____

Email: _____

For trials ☐ New drive ☐

For pilot series ☐ Existing drive ☐

For series production ☐ Requirement_____ pieces/year

Fitted with

Pitch length	Profile	Width	Manufacturer

DRIVING MACHINE

Type (e.g. electric motor, diesel engine 3 cylinders) _____

Size of starting torque (e.g. MA = 1.8 MN) _____

Method of starting (e.g. star delta) _____

Daily operating time _____ _____ hours

Number of switching operations per hour ☐ per day ☐

Change in the direction of rotation per minute ☐ per hour ☐

Output: P normal _____ kW

P maximum _____ kW

or max. torque _____ Nm at n_1 _____ min^{-1}

Speed of driver pulley n_1 _____ min^{-1}

Position of shafts: horizontal ☐ vertical ☐

inclined ☐ <) _____ °

Maximum allowed static shaft loading $S_{a\ max}$ _____ N

Pitch diameter or number of teeth on the pulley:

d_{w1} _____ mm z_1 _____ mm

$d_{w1\ min}$ _____ mm $z_{1\ min}$ _____ mm

$d_{w1\ max}$ _____ mm $z_{1\ max}$ _____ mm

Maximum pulley face width _____ mm

DRIVEN MACHINE

Type (e.g. lathe, compressor) _____

Start: under load ☐ no load ☐

Type of load: steady ☐ pulsating ☐

shock ☐

Required power: P normal _____ kW

P maximum _____ kW

or max. torque _____ Nm at n_2 _____ min^{-1}

Driven speed n_2 _____ min^{-1}

$n_{2\ min}$ _____ min^{-1}

$n_{2\ max}$ _____ min^{-1}

Maximum allowed shaft loading $S_{a\ max}$ _____ N

Pitch diameter or number of teeth on the pulley:

d_{w2} _____ mm z_2 _____ mm

$d_{w2\ min}$ _____ mm $z_{2\ min}$ _____ mm

$d_{w2\ max}$ _____ mm $z_{2\ max}$ _____ mm

Maximum pulley face width _____ mm

Speed ratio i _____ i_{min} _____ i_{max} _____

Drive centre distance a _____ mm a_{min} _____ mm a_{max} _____ mm

Tension/guide idler pulley: inside idler ☐ in drive slack side ☐

outside idler ☐ in drive tight side ☐

d_w _____ mm timing belt pulley ☐ moveable ☐ (e.g. spring loaded) _____

d_a _____ mm flat pulley ☐ fixed ☐

OPERATING CONDITIONS: Ambient temperature _____ °C min.

_____ °C/F max.

Exposure to oil ☐ (e.g. oil mist, droplets) _____

water ☐ (e.g. spray water) _____

acid ☐ (type, concentration, temperature) _____

dust ☐ (type) _____

Special conditions: E.g. for drives with inside or outside tensioning/idler pulleys, three or more multi-pulley drives or for drives with contra-rotating pulleys drawings are necessary.

Drive Details: _____
